(I) or (II) is useful for identifying substances which can bind with LPDL or LPDLR polyp, and for identifying a compound that affects the binding of LPDL or LPDLR polyp and an LPDL or LPDLR binding polyp. (I) or (II) or their nucleic acid is useful for identifying a compound that affects LPDL or LPDLR polyp activity or expression. (I) or (II) or their nucleic acid is useful for detecting or monitoring a condition associated with increased or decreased LPDL or LPDLR expression or activity in an animal, where the condition is lipase deficiency, atherosclerosis, fatty liver disease and dysilpidemias, such as hypercholesterolemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hypertriglyceridemia, mixed (combined) dyslipidemia, lipid or lipoprotein deficient states, and/or any other tissue or plasma disorders of lipid or lipoprotein metabolism. The nucleic acid is useful for diagnosing the presence of or a predisposition for a disorder in a subject which involves detecting a germline alteration in the nucleic acid in the subject. An inhibitor is useful for modulating triglyceride activity by inhibiting expression or activity of (I) or (II). The nucleic acid is useful as a probe or primer. The present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure;

                                                                                                                                                                                                                      CC produce yeast artificial chromosome (YAC) probes. The YAC probes are used to isolate the nucleic acid sequences of the invention. The specification Cd describes nucleic acid sequences of the invention. The specification CC describes nucleic acid sequences derived from a eukaryotic chromosome, CC including a neocentromere or its functional derivative or hybrid, that CC are able, in a compatible cell, of replicating, acting as extra-CC chromosomal element and segregating during cell division. The sequences CC can be used to construct artificial chromosomes for use in gene therapy CC comprising a replicable, segregating nucleic acid that confers a specific CC phenotype on cells. Human artificial chromosomes can propagate in human CC cells and carry large amounts of DNA (e.g. therapeutic genee), and, being CC extra-chromosomal, they are not mutagenic. The artificial chromosomes are CC also useful for generation of transgenic plants and animals, in CC production of proteins and to make diagnostic reagents, e.g. for CC copy number of a gene in a cell. The constructs may also be used for functional and structural analysis of chromosomes
                                                                                          Matches

COLID

Autonomously replicating DNA sequence - used to produce autonomously replicating plasmid for the production of heterologous proteins.

Example; Page 7; 15pp; Japanese.

AAT39826-T39833 represent amplification primers used to amplify the autonomously replicating DNA sequence (ARS) represented by AAT39825. The primers were used to amplify successively smaller regions of the HeLa HSP70 gene (including the 5' untranslated region) to obtain the ARS. The primer set designated A (AAT39826) amplified the largest HSP70 gene fragment. The next largest fragment was amplified by primer set D (AAT39827) and AAT39828), then set B (AAT39829 and AAT39830), and set C (AAT39831 and AAT39832) amplified the sequence shown in AAT39825. The sequences amplified by these primers all contained the HSP-MYC-A and HSP-MYC-B regions. The amplified ARS sequence is inserted into a plasmid which is then capable of autonomous replication in an episome state in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  host cells. The replication of this plasmid in the host cells is also very stable. The host cells used are cells derived from mammals, preferably from a human. The plasmid is useful to provide a large amount of heterologous peptide in recombinant cells. The offspring of an animal carrying the gene can be used as peptide producing animals
                                                                                                            Sequence 18
                                                                                                                                                  with anti-infective, anti-inflammatory and cytostatic activity. The oligonuclectides are RIP-1 antisense inhibitors and are used in the diagnosis, prevention and treatment of conditions associated with RIP-1 expression include various
                                                                                                                                                                                                        This sequence represents an antisense oligonuclectide which binds to the 3' untranslated region of RIP-1. RIP-1 (also known as RalBP1 and RIIP) is a GTPase activating protein (GAP) thought to be a downstream target of Ral. The invention relates to antisense phosphorothicate oligonuclectides
                                                                                                                                                                                                                                                                                 Example 15;
                                                                                                                                                                                                                                                                                                                                                    WPI; 2000-146889/13.

The invention relates to antisense phosphorothicate oligonucleotides with anti-infective, anti-inflammatory and cytostatic activity. The oligonucleotides are RIP-1 antisense inhibitors and are used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 18 BP; 5 A; 4 C; 5 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          diagnosis, prevention and treatment of conditions associated with RIP-1 expression. Conditions associated with RIP-1 expression include various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-FEB-2000

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention provides antisense compounds targeted to a coding region, 3'UTR or 5'UTR of a nucleic acid molecule encoding human CREL (transcriptional activator). The antisense compounds are useful as research agents and diagnostics such as in the elucidation of the function of a particular gene. The antisense compounds can be useful as therapeutic modalities that can be configured to be useful in treatment regimes for treatment of cells, tissues and animals, especially humans. In the prior art, there are no known therapeutic agents which effectively inhibit the synthesis of CREL and additional agents capable of inhibiting CREL function are still required. Sequences AR239588-627 represent

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking complete sites of single nucleotide polymorphisms SNPs. The present invention complete sites for determining the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a complete significance, the SNPE primer is used a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by complete significance are useful for determining the presence, absence or complete significance are useful for determining the presence, absence or complete seases by association analysis the genotyping an individual or group of complete the symptom analysis the genotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. complete sinsipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, completed of diseases, include symptoms of or susceptibility to multifactorial component is or may be genetic such as autoimmune confidence of which a component is or may be genetic such as autoimmune confidence including, rheumatoid arthritis, multiple sclerosis, muscular includes and in a component is or may be genetic such as autoimmune confidence, nearcer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and confidence in the method is also useful in forensic investigations and investigations and confidence in the method is also useful in forensic investigations and confidence in the method is also useful in forensic investigations and confidence in the method is also useful in forensic investigations and confidence in the method is also useful in forensic investigations and confidence in the such as a confidence in the method is also useful in forensic investigations and confidence in the confidence in the confidence in the confidence in the confidence in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC includes kits for determining the presence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid samples by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being CC caused by one or more SNPs. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease, CC craits also include symptoms of or susceptibility to multifactorial diseases of which a component is or may be genetic such as autoimmune CC disease of which a component is or may be genetic such as autoimmune concreases including, rheumatoid arthritis, multiple sclerosis, multiple sclerosis, multiple sclerosis, such as autoimmune concreases in the method is also useful in forensic investigations and CC paternity analysis. The metend tequence represents a PCR primer specific CC for a human SNP containing NNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

CC primer extension (SNPE) primers, and the sequences of regions flanking CC sites of single nucleotide polymorphisms SNPs. The present invention CC includes kits for determining the presence or absence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid sample by cassess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic traits suspected of being CC caused by one or more SNPs. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC diseases include symptoms of or susceptibility to multifactorial consteogenesis imperfecta and acute intermittent porphyria. Phenotypic CC inflammation, cancer, nervous system diseases and infection by pathogenic inflammation, cancer, nervous system diseases and infection by pathogenic consternity analysis. The present sequence represents a PCR primer specific for a Number of the present sequence represents a PCR primer specific for a termity analysis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         are commonly used as research reagents and in diagnostics for example, to elucidate the function of particular genes. The antisense compounds are also useful for distinguishing between functions of various members of a biological pathway and for research use. They are also utilized for diagnostics, therapeutics, prophylaxis and in kits. They are useful prophylactically, e.g. to prevent or delay infection, inflammation or tumor formation. Sequences AAH4753-47615 represent chimeric antisense phosphorothicate oligonucleotides having 2'-MCE wings and a deoxy gap, used for the inhibition of Her-3 mRNA expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   member

The present invention describes the human Zmax1 gene and the high mass (HBM) gene, which are found on chromosome 11q13.3. The Zmax1 a genes have osteopathic activities. The genes can be used in gene t antisense therapy and in the production of vaccines. They can be u
                                                                                                          New high bone mass (HBM) and Zmax1 genes and proteins useful modulating bone mass for the treatment of e.g. osteoporosis.

The Zmax1 and h genes have osteopathic activities. The genes can be used in gene thera antisense therapy and in the production of vaccines. They can be used the diagnosis and treatment of bone disorders including osteoporosis, paget's disease, sclerostosis, osteomalacia and fibrous dysplasia. hBA82038 to ABA82700 and AAG68168 to AAG68193 represent sequences used the exemnliffcation of the manual can be exemnliffcation of the manual can be exempliffication of the manual can be exempliffication of the manual can be exempliffication of the manual can be used the exempliffication of the manual can be used the exempliffication of the manual can be used the exempliffication of the manual can be used to be exempliffication of the manual can be used to be used the exempliffication of the manual can be used to be used the exemplification of the manual can be used to be used t

This invention relates to the sequence of an isolated nucleic acid CC molecule comprising at least one base variation from that of a known cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A1), cytochrome P450 A2 (CYP4501A2), CC cytochrome P450 O2E1 (CYP4501E1), adrenergic receptor beta1 (ADBR1), CC cytochrome P450 O2E1 (CYP4501E1), adrenergic receptor beta1 (ADBR1), CC cytochrome P450 O2E1 (CYP4501E1), adrenergic receptor beta1 (ADBR1), CC cytochrome P450 O2E1 (CYP4501E2), adrenergic receptor beta1 (ADBR1), CC cytochrome P450 O2E1 (CYP4501E2), adrenergic receptor nuclear translocator (C (ANNT), cathepsin S (CTSS), cytochrome P450 A2 (CYP4501A2), CC (CYP4501A2), adrenergic receptor nuclear translocator (CXP2), diazepam binding CC (ANDB1), plutathione-S-transferase (CXP2), histamine-N-methyl CC transferase (NNWT), (Kallikrein 2) KIKZ, nicotinamide -N-methyl CC transferase (NNWT), NADPH quinone oxidoreductase 2 (NQO2), CC (NGC1), UDP-glucuronosyl transferase 2B4 (CYT2B4), UDP-glucuronosyl transferase 2B7 (CYT2B7), UDP-glucuronosyl CC (MT2B4), UDP-glucuronosyl transferase 2B7 (CYT2B7), UDP-glucuronosyl cransferase (UGT2B15), urokinase receptor (UPA), multidrug resistance 1 (MT2), actotransferrin (LTF), multidrug resistance associated protein 3 (CTP4), actotransferrin (LTF), multidrug resistance associated protein 3 (CTP4), or actylcholine muscarinic CC receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2), CHMR3, CHMR4 or CHMR5) sequence. CC The polymorphisms in the human genes cited in the invention are useful as genetic linkage markers for locating and characterising the genes that CC act responsible for specific traits within the genome and eventually cidentifying the genes responsible for a variety of disorder-related CC craits as a result of their e.g., overexpression, which may be used in diagnosing capturession, mutation or underexpression, which may be used in diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               aryl hydrocarbon receptor nuclear translocator; ARNT; cathepsin S; CTSS; cyclooxgenase 2; COX2; diazepam binding inhibitor; DBI; haematological; epoxide hydroxylase 2; EPHX2; 5-lipoxygenase activating protein; FLAP; glutathione-S-transferase 12; GST12; histamine-N-methyl transferase; HAMT; kallikrein 2; KLK2; nicotinamide-N-methyl transferase; NNMT; NADPH quinone oxidoreductase 2; NOQ2; sulfotransferase thermolabile; STM; UDP-glucuronosyl transferase 2B7; UDP-glucuronosyl transferase 2B7; urokinase receptor; uPA; multidrug resistance 1; lactotransferrin; orphan nuclear receptor; multidrug resistance associated protein 3; cancer; prostate; acetylcholine muscarinic receptor; CHMR1; CHMR2; CHMR3; CHMR4; CHMR5; altered drug metabolism; cardiovascular function; colorectal tumour; central nexture systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 22; Page 141; 714pp; English

```
polymorphic sequences contained in CYP4501A1, CYP4501A2, CYP4502B1, ARNT, EPHX2, GST12, NMMT, NQO2, NRII2, STM, UGT2B4, UGT2B7, UGT2B15, AHR, MDR1 and/or MDR3 are useful for screening individuals for altered drug metabolism. The polymorphic sequences contained in CYP4501A1, CYP94501A2, AHR, MDR1 and/or MDR3 may also be used to screen individuals for susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are used to screen for altered cardiovascular function, in COX2 for altered susceptibility to colorectal tumours, in DB1 or CHMR1 for altered central nervous system function, in FLAP and HNWT for altered pulmonary, immunological or haematological function, in KLK2 for altered serine protease activity in the prostate, in LTF for altered immunological or haematological function, in CHMR3, CHMR4 or CHMR5 for altered central peripheral nervous system function. The present sequence represents a PCR primer used to amplify the sequences of the invention

Disclosure; Page 39; 409pp; English.

The invention relates to a method for identifying a molecule involved in lipid regulation comprising identifying a molecule that binds to or inhibits binding of a molecule to high bone mass (HBM) or its wild type gene, Zmax1. Compounds identified by the method are useful for treating, diagnosing, preventing or screening for normal and abnormal lipid-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         conditions caused by plaque build-up, poor circulation due to plaque build-up and associated poor wound healing. The methods may be used in gene therapy, pharmaceutical development, and diagnostic assays for bone development disorders. Molecules identified by comparison of Zmax1 and HBM systems can be used as surrogate markers in pharmaceutical development, in diagnosis of human or animal bone disease, and in the treatment of bone diseases. Sequences ABK22776-ABK23411 represent cDNA molecules encoding human Zmax1 and HBM, and PCR primers, probes, linkers
                        The present invention describes human NEDL-1 is located to chromosome 7, more specifically to 7p. The present invention also describes a nucleic acid probe comprising: (a) a nucleic acid with a lof the base sequence of the 6200 base pair sequence given in ACC49481 (I), or its complementary base sequence; or (b) a nucleic acid hybridisable with the nucleic acid with a base sequence of (I) or its complementary base sequence under stringent conditions. The NEDL-1 ger and its encoded protein can be used in the diagnosis and prognosis of neuroblastoma. The present sequence represents a PCR primer for GAPDH, which is used in an example from the present invention
                                                                                                                                                                                                      Novel gene NED-1 as probes of neuroblastoms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 18
                                                                                                                                                                                                                                               WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                             The invention relates to novel transgenic animals expressing the high CC bone mass (HBM) gene, expressing the corresponding wild type HBM gene, comprising an alteration of the gene encoding LRP5 or LRP6, or expressing CC an LRP5 that is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are CC for the study of bone density modulation or bone mass modulation. The conclude invention has osteopathic and cycostatic activity. The polymucleotides of CC the invention may have a use in gene therapy. The transgenic animals and CC nucleic acids are for the study of bone density modulation, where the CC strength, trabecular number, bone size, or bone tissue connectivity. The cransgenic animals, nucleic acids and methods are useful for identifying CC molecules involved in bone development, and for developing pharmaceutical CC mospositions, which may be employed for treating or preventing bone CC diseases, e.g. osteoporosis, osteomalacia, rickets, Paget's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, and for most are also cuseful in methods for diagnosing diseases involved in bone development, or characterised by reduced bone density or mass. The present sequence is cused in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New transgenic animals (e.g. mice), useful as models for studying bone density modulation, developing drugs for treating or preventing bone diseases (e.g. osteoporosis), or diagnosing diseases characterized by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        11-MAY-2001; 2001US-0290071P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       5
                                                                                 The invention relates to novel transgenic animals expressing the high CC bone mass (HBM) gene, expressing the corresponding wild type HBM gene, comprising an alteration of the gene encoding LRP5 or LRP6, or expressing CC an LRP5 that is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are CC for the study of bone density modulation or bone mass modulation. The comparation and cytostatic activity. The polyunclectides of the invention may have a use in gene therapy. The transgenic animals and nucleic acids are for the study of bone density modulation, where the bone mass is modulated relative to non-transgenic animals of the same competes in more than one parameter selected from bone density, bone strength, trabecular number, bone size, or bone tissue connectivity. The cransgenic animals, nucleic acids and methods are useful for identifying molecules involved in bone development, and for developing pharmaceutical compositions, which may be employed for treating or preventing bone consection methods for diagnosing diseases involved in bone development, or constants and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, in the expension of the invention of the i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               11-MAY-2001;

                                                                                                                                                                                                                                      The present invention describes the human BMCC1 protein. The BMCC1 gene has high homology with a part of BNIP2, and is located to the chromosome 9. BMCC1 has cytostatic activity. The BMCC1 protein and its encoded gene are applicable in studying biology, pathology and the onset of cancer. BMCC1 can also be used in the diagnosis, prognosis and screening of drugs for tumour e.g. neuroblastoma, including the provision of gene data and protein function on human neuroblastoma. The present sequence represents a PCR primer for human GAPDH, which is used in an example from the

The method is useful for determining the presence of the desired NA. The method CC is useful for determining the presence or absence of desired nucleic cacids that contain multiple repeats of a predetermined NA target CC sequence, in a NA sample obtained from a biological sample, where the CC distinguishing human and bacterial NA. The method is analyse detection and quantification of the presence of a NA without the need to undergo a NA target sequence enrichment step prior to a NA CC hybrid detection step. The method enables rapid and accurate detection of a desired NA that contains multiple repeats of a NA target sequence. This sequence represents a probe used to detect the human Alu repeat sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) ar LRP6 mutants, which results in a HBM-like phenotype when expressed in cell. The HBM-like phenotype results in bone mass modulation and/or lilevel modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence is a Sequence Tagged Site (STS) marker, which was used to prepare a physical map of the Zmax1 (LRP5) creation.

The HBM-like phenotype results in bone mass modulation and/or lipid level modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence is a Sequence Tagged Site (STS) marker, which was used to prepare a physical map of the Zmax1 (LRP5) gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               diagnosing a HBM-like phenotype in a composition for modulating bone mass suffering from e.g. osteoporosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cell, and the sample is metaphase spreads, interphase nucleic cell, and the sample is metaphase spreads, interphase nucleic or nucleic found in paraffin embedded tissue material or frozen tissue sections. The probe is also useful in comparing a sample of genomic nucleic acid with that of a control sample using a genomic nucleic acid reference array. The method comprises treating a sample of genomic nucleic acid and control genomic nucleic acid and control genomic nucleic acid and control genomic nucleic acid and the array with the mixture of the probe under suitable hybridization conditions, contacting the array with treated mixture of sample and control genomic nucleic acid and the array with treated mixture of sample and comparing the intensities of the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus determining one or more variations in copy numbers of sequences in the carray is determined using an intercalating dye or a detectable antibody, or its fragment, that is specific for a nucleic acid/nucleic acid hybrid. The sample of genomic nucleic acid to be tested and the reference of nucleic acid are labelled with detectable moiety such that hybridization of the genomic array is determined by determining the presence, amount or location of the detectable moiety such that hybridization of the genomic array is determined by determining the presence, absence, amount or location of the detectable moiety such that hybridization carrays. The genomic array comprises nucleic acid that is prepared from Bacterial Arctificial Chromosome (BAC) clones. The presence absence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present suseful for suprobes, that

The method comprises contacting the sample with the mixture of probes (preferably comprising 5-50 probes), contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one or more detectable nucleic acid probes to the target genomic nucleic acid of the sample. The genomic nucleic acid is contained in a fixed tissue or a coll the sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an ass for determining target genomic nucleic acid of a sample. The method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 18

```
for determining target genomic nucleic acid of a sample. The method comprises contacting the sample with the mixture of probes (preferably comprising 5-50 probes), contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one more detectable nucleic acid probes to the target genomic nucleic acid probes to the target genomic nucleic acid the sample. The genomic nucleic acid is contained in a fixed tissue or the sample. The genomic nucleic acid is contained in a fixed tissue or the sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Non-nucleotide probe for suppressing binding of detectable nucleic acid probes to undesired sequences, has aggregate nucleobase sequence homologous to randomly distributed repeat sequence of genomic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Kirtsen NV, Hyldig-Nielsen JJ, Williams \P^1
                                                                                                                                                                                                                                                                                                                                                                                                                                                     cell, and the sample is metaphase spreads, interphase nucleic or nuclein found in paraffin embedded tissue material or frozen tissue sections. The probe is also useful in comparing a sample of genomic nucleic acid with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a non-nucleotide probe. The probe is useful for suppressing the binding of one or more detectable nucleic acprobes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an assumption.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 10;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2003-421160/39.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SEQ ID NO 21; 103pp; English.

ADH7 Matches Query Match Best Local : The method comprises treating a sample of genomic nucleic acid and control genomic nucleic acid, which are differentially labelled, the array or both the sample and control genomic nucleic acid and the array with the mixture of the probe under suitable hybridization conditions, contacting the array with treated mixture of sample and control genomic nucleic acid under suitable hybridization conditions, and comparing the intensities of the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus determining one or more variations in copy numbers of sequences in the sample as compared with the relative copy numbers of substantially identical sequences in the control. The hybridization of the genomic array is determined using an intercalating dye or a detectable antibody, or its fragment, that is specific for a nucleic acid/nucleic acid hybrid. The sample of genomic nucleic acid to be tested and the reference of nucleic acid are labelled with detectable moiety such that hybridization of the genomic array is determined by determining the presence, absence, amount or location of the detectable label on the one or more genomic arrays. The genomic array comprises nucleic acid that is prepared from Bacterial Artificial Chromosome (BAC) clones. The present sequence represents a non-nucleotide probe of the invention. human; T-cell associated disease; Vbeta; autoimmune disease; degenerative nervous system disease; graft versus host disease; degenerativity disease; infectious disease; neoplastic dis Addison's disease; atrophic gastrilis; degenerative nervous system disease; multiple sclerosis; Sequence 18 BP; 4 A; 7 C; 3 G; 4 T; 0 U; 0 Other; that of a control sample using a genomic nucleic acid reference array. Degenerative nervous system diseases include multiple celerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivity diseases include Type I hypersensitivity diseases include Type allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta microsatellite primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, graft versus host disease, hypersensitivity diseases, infectious disease, and neoplastic diseases. Autoimmune diseases include Addison's disease, and neoplastic diseases. Autoimmune diseases include Addison's disease,

sequence comprising one or more of the nucleotide exchanges (SNP's) given in the specification and at least 8 bases of surrounding sequence of the MCHR1 gene. The composition has anorectic activity. The polynucleotide composition may be used in gene therapy to treat the disorders of the invention. The composition is useful for diagnosing obesity related to the presence of a molecular variant of the MCHR1 gene or a susceptibility to the disorder. The MCHR1 protein or polynucleotide is useful for preparing a medicament for treating or preventing obesity related to presence of a molecular variant of the MCHR1 gene. This polynucleotide represents an MCHR1 primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New diagnostic composition, useful presence of a molecular variant of the disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel diagnostic polynucleotide composition. The polynucleotide composition comprises: a sequence encoding a polypeptide with defined sequences given in the specification; a sequence capable of hybridizing to a melanin-concentrating hormone receptor 1 (MCHR1) gene; a polynucleotide encoding an MCHR1 polypeptide; or a melanin-concentration provided the concentration of the concen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Platzer M,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human glycoprotein VI (platelet) (GP6; GPIV;GPVI) DNA which is located at chromosomal position 19q13.4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI;

of breast cancer comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a subject at risk of breast cancer, for early diagnosis, prevention and treatment of breast cancer, possibly via gene therapy, as well as to analyse and predict a response to a breast cancer treatment and in clinical drug trials. The current sequence is that of an Extend primer (also described as probe) the invention which was used to genotype human Rho family guanine-nucleotide exchange factor KIAAO861 gDNA which has been mapped to The invention relates to a novel method for identifying a subject at of breast cancer comprising detecting the presence or absence of one chromosomal position 3q27.3. , e of f

New human teratocarnogenesis related protein and its coding sequence.

Example 1; Page 10; 21pp; Chinese

The present invention describes the human teratocarcinogenesis related protein, designated hTera, which is expressed in normal human marrow. Also described is a method for the preparation of the hTera protein and nucleic acid sequences, and a method of detecting human hTera nucleic acid and polypeptide sequences in sample. The present sequence represent a PCR primer used in the isolation of hTera in an example from the a PCR primer used present invention represents and

                                                                                                                                                           The present invention relates to the isolation of novel human and mouse VMGLOM polypeptides (long form and short form), and the nucleic acid molecules encoding them. VMGLOMs (also referred to as glomulins) are a subtype of venous malformations (VMs) called glomangiomas. In humans, VMGLOM has been mapped to chromosome 1p21-22. VMGLOMs and the nucleic acids encoding for them are useful as a medicament or for incorporation into a diagnostic kit. Such medicaments are useful for preventing, treating or alleviating disorders with a vascular component, particularly where alteration of vascular smooth muscle cell phenotype is needed, e.g. varicosities, cardiopathies or cardiomyopathies, cerebral disorders and cancer. The nucleic acids are also useful in gene thorapy. The present sequence for PCR primer 1 is used to amplify PAC 812f10 (54 T7) clone STS
                                                                                                                                                                                                                                                                                                                                                                                     New VMGLOM genes and polypeptides, useful in gene therapy or for preventing, treating or alleviating disorders with vascular component, e.g. varicosities, cardiopathies, cerebral disorders or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; VMGLOM; glomulin; venous malformation glomangioma; PCR primer; STS; sequence tagged site; PAC 812f10; ss.

The invention also details methods for testing toxicity of substances on the human liver cells and the metabolic conditions of substances by the liver cells. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             multiplex PCR amplification from limiting amounts of target nucleic aci The methods are also useful for improving genetic diagnostic and screening methods, such as prenatal diagnostic testing, foetal sex determination or genetic identification, e.g. DNA profiling or DNA fingerprinting. The nucleic acid sequence amplification is also useful forensic analysis of degraded, old, ancient and difficult samples that are difficult to amplify and identify. This sequence represents a PCR are difficult to amplify and identify. This sequence represents a PCR are difficult to amplify and identify.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a method of selecting genetic markers as targets for nucleic acid sequence amplification comprising selecting each of the genetic markers according to a heterozygosity index of 0.5 or greater. Selecting and amplification of genetic markers are useful as targets for selecting and amplification for genetic testing or facilitating nucleic acid sequence amplification, for genetic testing or facilitating amounts of target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Selecting genetic markers as targets for nucleic acid sequence amplification, useful for improving genetic testing, e.g. fetal determination, comprises selecting each of the genetic markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 19.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        comprising a variant gene associated with an eating disorder and select from any of 119 polymorphisms with their corresponding genotyping in dataset, alleles and HGBAGE identification, given in the specification. The novel nucleic acid molecule has polymorphisms in the serotonin receptor 1D, delta-opioid receptor, or dopamine receptor D2, which is useful in diagnostic and prognostic assays for eating disorders, in particular anorexia nervosa and bulinia nervosa. This polymucleotide sequence represents a opioid receptor 1D PCR primer of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and

autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

Disclosure; SEQ ID NO 963; 164pp; English

atrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infectious caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, graft versus host disease, hypersensitivity diseases, infectious disease and neoplastic diseases. Autoimmune diseases include Addison's disease, Sequence breast. The present sequence represents a Vbeta gene repeat sequence 19 BP; 3 A; 0 C; 0 G; 16 T; 0 U; 0 Other; diseases

The kit is useful for diagnosing organ transplant CC rejection and diagnosing and treating T-cell associated diseases. CC including autoimmune diseases, degenerative nervous system diseases, CC graft versus host disease, hypersensitivity diseases, infectious diseases, CC and neoplastic diseases, hupersensitivity diseases, infectious diseases, CC and neoplastic diseases, autoimmune diseases include Addison's diseases, CC artophic gastritis. Degenerative nervous system diseases include multiple control of the past such as contact with allergens that lead to CC allergies, Type II hypersensitivities such as those present in CC Goodpasture's syndrome and Type IV hypersensitivities such as those caused by viruses such as HIV, fungal infections such as those caused by CC graft genus Candida, parasitic infections such as those caused by CC such as genus Candida, parasitic infections such as those caused by CC such as leukaemias, lymphomas and cancers such as cancer of the brain, CC such as Indexended to the past. The present sequence represents a Vbeta microsatellite primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 1620

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a kit for diagnosing and treating T-cell cossociated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, the kit is useful for diagnosing organ transplant complete in the kit is useful for diagnosing organ transplant concluding autoimmune diseases, degenerative nervous system diseases, compared the versus host diseases, hypersensitivity diseases, infectious diseases, cand neoplastic diseases. Autoimmune diseases include Addison's diseases, can depolastic diseases. Autoimmune diseases include Addison's diseases, can depolastivities such as contact with allergens that lead to compasture's syndrome and Type IV hypersensitivity diseases include Type Compasture's syndrome and Type IV hypersensitivities such as those caused by viruses such as HIV, fungal infections such as those caused by caused by viruses such as HIV, fungal infections such as those caused by consistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections are caused by chistosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 1621
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

Also described: (1) a chimera mouse having transplanted human hepatocytes in the mouse from the liver; (2) a method of obtaining human hepatocytes by separating the human hepatocytes from the liver of the chimera mouse; (3) the human hepatocytes from the liver of the chimera mouse; (3) the human hepatocytes are filled. The method can be used as human hepatocytes proliferation method for producing an artificial liver in which human hepatocytes are filled. The present sequence represents a PCR primer which is used in an example from the present invention.

Example; SEQ ID NO 52; 121pp; English

CC The present invention describes a method (M1) for identifying a hair CC growth modulator. (M1) comprises identifying a P-cadherin modulator, and CC testing whether the P-cadherin modulator is functional as a hair growth CC modulator. Also described: (1) a hair growth modulator (1) identified by CC (M1); and (2) a composition (II) for modulating hair growth, comprising, CC as an active ingredient, a P-cadherin modulator functional as a hair CC growth modulator. (I) and (II) have endocrine and depilatory activities, CC and can be used as hair growth modulators, P-cadherin function CC modulators, and in gene and antisense therapy. (M1) is useful for CC identifying a hair growth modulator. (1) is useful in a method of medical CC treatment. (I) or (II) is useful for modulating hair growth for non-CC (I) or (II). (I) can be used in the manufacture of a medicament for the therapeutic modulation of hair growth. (I) or (II) is useful for treating CC (II) comprising P-cadherin inducer is useful for correction of hair loss in congenital hypotrichosis associated with juvenile macular dystrophy (CC invention.) and other alopecia patients. The present sequence represents a PCR conjunction. nvention.

The primers correspond to the unique DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (ie. a difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 4 primer pairs are shown in AAQ95465-480 and AAQ95559-590. The chromosomal markers, published size range of the allele and degree of heterozygosity in the population for the markers covered by these primer pairs are not given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The method aims to provide a collection of highly reproducible microsatellite marker sequences (MMS) at approx. 10-50 cM into throughout the human genome which can be detectably labelled.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Kits comprise at least 4 groups, of at least 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 6 primer pairs are shown in AAQ95639-686. The published size range of the D8S265 allele is 284-307 bp, and the degree of heterozygosity in the population is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (ie. a difference in the number of repeats) between individuals, the markers be particularly informative. The MMS can be ideal for linkage studies.

disease and correlating their recommendations, forensics, paternity used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a nolumorphic site described in the exemplification of the invention The present invention describes a method for detecting the presence of polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowed disease and correlating their occurrence with disease states. They may detect þė

Testing for the prese bowel disease, using

for the presence of polymorphisms associated isease, using a hybridization assay.

                                                                                                                                                                                          The present invention describes a method of arraying genome clones. The cmethod comprises: (a) clones of the genomic libraries contained in cc multiwell plates numbered for discrimination are mixed in each of the cc multiwell plates; (b) a primer designed based on the chromosome marker cc sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant cc amplified product to specify the discrimination Nos. of the multiwell cc plates containing the clones having said marker sequence; (d) the order cof the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell cc plates; (e) the clones in the multiwell plates of the specified condiscrimination Nos. are mixed respectively in each wells of longitudinal cc and lateral directions; (f) the mixed clones are cultured and the cc resultant cultures are amplified by using the above primer; (g) signals care detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are cc reconstituted as the positions on the chromosome and arrayed. The cc primers for human chromosome 1936-35 DNA, and ABL45322 represent CC represent por primers for human chromosome 1936-35 DNA, and ABL45321 to ABL45634
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                gene from a subject, and detecting the presence or absence of one or more variations in the ADAMTS13 gene. The method of the invention has thrombolytic and haemostatic activity. The methods and compositions of the present invention are useful for the diagnosis and treatment of, and/or analysing risks for thrombotic thrombocytopenic purpura. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; thrombotic thrombocytopenic purpura; TTP; disintegrin; metalloproteinase; thrombospondin 1-like domains 13; ADAWTS13; thrombolytic; haemostatic; PCR; primer; RT-PCR; 5' RACE; 3' RACE; se
                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel method for identifying subjects at risk of developing thrombotic thrombocycopenic purpura (TTP) disease, comprising providing nucleic acid having a disintegrin and metalloproteinase containing thrombospondin 1-like domains 13 (ADAMTS13)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying risk of developing thrombotic thrombocytopenic disease, using a novel disintegrin and metalloproteinase cothrombospondin 1-like domains genes and proteases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ginsburg D,

                                                                                                                                                                                                            The present invention describes a compound 8-50 nucleobases in length CC targeted to, and which specifically hybridises with a nucleic acid CC molecule encoding HKR1, and inhibits the expression of HKR1. Also CC described: (1) a compound 8-50 nucleobases in length that specifically CC hybridises with at least an 8-nucleobase portion of an active site on a CC nucleic acid molecule encoding HKR1; (2) a composition comprising the CC compound and a carrier or diluent; (3) a method for inhibiting the CC expression of HKR1 in cells or tissues by contacting the cells or tissues when the compound so that expression of HKR1 is inhibited; and (4) a CC with the compound so that expression of HKR1 is inhibited; and (4) a cC with HKR1 by administering to the animal a therapeutic or prophylactic compount of the compound so that expression of HKR1 is inhibited. HKR1 CC amount of the compound so that expression of HKR1 is inhibited. HKR1 CC annissense oligonucleotides have cytostatic activities and can be used as CC HKR1 inhibitors. The compound, composition and methods are useful for CC treating a disease or condition associated with HKR1, such as a CC hyperproliferative disorder, e.g. lung, brain or breast cancer, by cinhibiting the expression of HKR1. They are also useful in research and CC diagnostics for modulating the expression of HKR1. The present sequence cc represents a human HKR1 chimeric phosphorothoate oligonucleotide having 2'-O-methoxyethyl (2'-MOE) wings and a deoxy gap, which is an antisense CC the present and the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the compound in the inhibitio

                                                                                                                                                                                                Critically hybridise to novel chimeric antisense oligonucleotides that especifically hybridise to and inhibit the expression of the nucleotide combinding oligonucleotide domain 1, NOD1 protein. NOD1, also known as CARD4 (caspase associated recruitment domain 4) is a domain that is involved in the elimination of cells via programmed cell death and in the host combined to cell of the elimination of cells via programmed cell death and in the host combined to cell loss and neurodegenerative conditions including combined to cell loss and neurodegenerative conditions including combined to the development of lateral sclerosis (ALS), retinitis companies and blood cell disorders. Conversely, insufficient apoptosis can contribute to the development of cancer, autoimmune disorders and combined to the development of cancer, autoimmune disorders and combined to the development of cancer, autoimmune disorders and combined that can modulate NoD1 expression (and variants to cligonucleotides that can modulate NoD1 expression (and variants coligonucleotide sequence is the chimeric antisense oligo used to inhibit coligonucleotide sequence is the chimeric antisense oligo used to inhibit combined to the invention. Note that it has two combined to the development of the invention. Note that it has two combined to decreate the combined to the chimeric antisense oligonucleotide aga. The oligonucleotide backbone is phosphorothioate.

                                                                                                                                                                                                                                                                                                                                                                             and hepatotropic activity. A polynucleotide of the invention may have a use in gene therapy, or in a vaccine. The compound capable of modulating the level of activity of the OAS, RNase L or 2'-5' phosphodiesterase gene and/or activity of the OAS, RNase L or 2'-5' phosphodiesterase grotein is useful in the manufacture of a medicament for treating a patient with or at risk of hepatitis C infection. The nucleic acid that hybridises selectively to OAS nucleic acid is useful in the manufacture of a medicament or diagnostic reagent for treating or diagnosting a patient with or at risk of hepatitis C infection. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel compound capable of modulating the level of activity of the 2',5'-oligoadenylate synthetase (OAS), RNase L or 2'-5' phosphodiesterase gene or protein, useful in the manufacture of a medicament for treating a patient with or at risk of hepatitis C infection, where the compound is not an interferon or an isoprenoid, such as geranylgeranylacetone (GGA). The method of the invention has virucide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of a compound capable of modulating the level of activity of the OAS, RNase L or 2'-5' phosphodiesterase gene or protein in the manufacture of a medicament for treating a patient with or at risk of hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo

```
cc junctions of genes encoding a polypeptide associated with lung and/or cc nasal airway dysfunction and a second active agent comprising an cc antiinflammatory steroid and ubiquinone. A composition of the invention cc has antiinflammatory, antiallergic, antiasthmatic, hypotensive, has antisinflammatory, antiallergic, antiasthmatic, hypotensive, cc use in antisense gene therapy. The composition is useful for treating or cc use in antisense gene therapy. The composition is useful for treating or cc reventing a respiratory, lung or malignant disease or condition, also composition as useful for treating or cc rentancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of or reducing sensitivity to adenosine, reducing or depleting levels of of creeptor, producing bronchodilation, increasing levels of adenosine cc lung surfactant in a subject stissue, or treating bronchoconstriction. Cc lung inflammation, lung allergies, or a respiratory disease or condition. Cc Note: The sequence data for this patent is not represented in the printed capacition, but was obtained in electronic format directly from WIPO as ferrowers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene trantisense gene therapy; respiratory; lung adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allung inflammation; respiratory disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel pharmaceutical composition, which has first active agent comprising an oligonucleoties antisense to the initiation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3 intron-exon junctions, or regions within 2-10 nucleotides of

CC expression of a target polypeptide associated with lung airway or lung content of a target polypeptide associated with lung airway or lung content on a lab describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, and beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung cinflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, conformation, allergies, asthma, impeded respiration, respiratory construction, allergies, asthma, impeded respiration, respiratory transplantation rejection, pulmonary vasoconstriction, respiratory construction, allergies, asthma, impeded respiration, respiratory construction, pulmonary pulmonary disease, pulmonary pulmonary disease, pulmonary pulmonary disease, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system ce.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

                                                                                                                                               susceptibility, as well as diagnosis, prevention and treatment of various disorders including chronic obstructive pulmonary disease, rheumatoid arthritis, inflammatory bowel disease, psoriasis or asthma. Accordingly, the compositions of this invention exhibit antiasthmatic, antiinflammatory and antiallergic activities. Furthermore, they may be used to identify patients that would be strong candidates for effective treatment with a CARD4 modulator, in pharmacogenomics, or in monitoring the effects of CARD4 therapeutics during clinical trials. The nucleic acid molecule may also be used in forensics or paternity testing. This oligonucleotide sequence is a PCR primer used to amplify a human CARD4 DNA oligo comprising an allelic variant of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to novel single nucleotide polymorphisms within the human CARD4 gene. Specifically, it refers to allelic variants of CARD4 (NOD1), a member of the CED4/Apaf-1 family that is involved in caspase-9 induced apoptosis and inflammation. The present invention describes a kit for determining the allelic variants of CARD4 polymorphic regions of an individual, which can be useful for predicting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid molecule comprising CARD4 gene, useful for diagnosing, preventing apoptotic, inflammatory or allergic disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antiasthmatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       inflammation; chronic obstructive pulmonary disease; rheumatoid arthritis; inflammatory bowel; psoriasis; asthma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PCR primer

                                                                                                                                   The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding LIM domain kinase 1. The compound specifically hybridises with the nucleic acid molecule encoding LIM domain kinase 1 and inhibits the expression of LIM domain kinase 1. It specifically hybridises with at least an 8-nucleobase portion of a preferred target region on the nucleic acid molecule encoding LIM domain kinase 1. The antisense oligonucleotide is useful for modulating the expression of LIM domain kinase 1 in cells or tissues to treat diseases associated with their expression, such as a developmental disorder or a neurological disorder. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a human LIM domain kinase 1 antisense oligonucleotide.
                                                                                                            Sequence 20
                                                                                                                                                                                                                                                                                                                                                       New antisense oligonuclectides for modulating LIM domain kinase 1 expression, useful for diagnosing, preventing or treating conditions associated with the kinase, e.g. neurological or developmental disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Cowsert LM,

                                                                                                                                                     specifically hybridises with the nucleic acid molecule encoding LIM domain kinase 1 and inhibits the expression of LIM domain kinase 1. It specifically hybridises with at least an 8-nucleobase portion of a preferred target region on the nucleic acid molecule encoding LIM domain kinase 1. The antisense oligonucleotide is useful for modulating the expression of LIM domain kinase 1 in cells or tissues to treat diseases associated with their expression, such as a developmental disorder or a neurological disorder. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                          New antisense oligonucleotides for modulating LIM domain kinase 1 expression, useful for diagnosing, preventing or treating conditions associated with the kinase, e.g. neurological or developmental disorders.

                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (II)-4 receptor, II-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       airway inflammation; allergy; asthma; impeded respiration; cystic fibrosis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; oligonucleotide;
                                                                                                                                                                                                                                                                                              useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway (ARDS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant genes e.g., CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oligonucleotide associated

antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides, cardiant, neuroprotective, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, aphthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

```
The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9334.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric and the sequence of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mpGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiarthitic; vasotropic; ophthalmological; neuroprotective; nootropic; antiarthitic; vasotropic; ophthalmological;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The oligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; ss; interleukin-4 receptor; IL-4; interleukin-5 receptor; IL-5; CCR1; CCR3; Ectaxin-1; RANTES; MCP4; CD23; ICAM; VCAM; tryptase a; tryptase b; PDB4 A; PDE4 B; PDB4 C; PDE4 D; respiratory disease; lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; impeded respiration; cystic fibrosis; CP; chronic obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; airway obstruction; bronchoconstriction.
                                                                                                                                                                                                                                    Novel single or multiple target oligonucleotide anti-sense to e.g. Conitiation codon, intron of respiratory disease-relevant gene e.g. CORANTES, MCP4, useful for prophylaxis or treating respiratory disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AD046426

                                                                                                                                                                            tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A receptor(s), and/or asthma and/or lung allergies associated with inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD),
                                                                                      allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or bronchoconstriction. This sequence represents an oligonucleotide of the

Identifying a subject at risk of breast cancer by detecting the presence of polymorphic variations in the ICAM, MAPK10, KIAA0861, NUMA1 or GALE regions which are associated with breast cancer in a nucleic acid sample ដា subject.

Example 4; Page 83; 289pp; English

The invention relates to a novel method for identifying a subject at right of breast cancer comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a subject at risk of breast cancer, for early diagnosis, prevention and treatment of breast cancer, possibly via gene therapy, as well as to analyse and predict a response to a breast cancer treatment and in clinical drug trials. The current seminere is that of an extend extend from the course of the course o current sequence is that of an Extend primer of fi

IĈAM-1 (human rhinovirus receptor; BB2; CD54; cell surface glycoprotein P3.58) has been mapped to chromosomal position 19p13.3-p13.2, ICAM-4 (Landsteiner-Wiener blood group; LW) has been mapped to chromosomal position 19p13.2-cen and ICAM-5 (telencephalin) has been mapped to chromosomal position 19p13.2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    alpha-methylacyl-CoA racemase; AMACR; fat gene therapy; antisense; 2'-methoxyethyl phosphorothioate backbone; ss; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                            The invention relates to a novel compound having a sequence comprising 8-80 bp which is targeted to a nucleic acid encoding alpha-methylacyl-CoA racemase (AMACR), specifically hybridises with the nucleic acid encoding alpha-methylacyl-CoA racemase and inhibits the expression of alphamethylacyl-CoA racemase and inhibits the expression of the invention may be useful for preparing a composition for treating a disease or condition involving defects in fatty acid metabolism, possibly via gene therapy. The current sequence is that of a antisense 2'-methoxyethyl (2'-MOE) gapmer oligo of the invention which was targeted to human AMACR RNA.
                                                                                                                                                                                                                 New oligonucleotide compound that inhibits expression of alpha-methylacyl-CoA racemase, useful for preparing a composition for treating a condition involving defects in fatty acid metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the invention which was used to genotype human intercellular adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense 2'-MOE gapmer targeted to human AMACR RNA -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     09-SEP-2004

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel compound having a sequence comprising 8 80 bp which is targeted to a nucleic acid encoding alpha-methylacyl-CoA racemase (AMACR), specifically hybridises with the nucleic acid encoding alpha-methylacyl-CoA racemase and inhibits the expression of alphamethylacyl-CoA racemase. The oligonuclectide compound of the invention may be useful for preparing a composition for treating a disease or condition involving defects in fatty acid metabolism, possibly via gene therapy. The current sequence is that of a human AMACR DNA of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New oligonucleotide compound that inhibits expression of alpha-methylacyl-COA racemase, useful for preparing a composition for treating a condition involving defects in fatty acid metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            alpha-methylacyl-CoA racemase; AMACR; fatty acid metabolism;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              09-SEP-2004

The products of the invention have cytostatic and antithyroid activity and can be used in gene therapy. Nucleic acids, polypeptides, and antibodies of the invention may be used in the diagnosis and/or the therapy of the malfunction of the thyroid and/or hyperlasias of the thyroid and/or thyproid tumors. They may also be used in the production of medicaments. (N1) can also be used to diagnose thyroid tumors which are located on chromosome 19 at band 19q13. This sequence represents a PCR primer used in the isolation of the thyroid malfunction—associated protein, RITA

Isolated nucleic acid molecules having polymorphisms in known human genes. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.
This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    acetylcholine muscarinic receptor; CHMR1; CHMR2; CHMR3; CHMR4; CHMR5; altered drug metabolism; cardiovascular function; colorectal tumour; central nervous system; pulmonary; immunological.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            28-NOV-2001; 2001WO-US044838.

Determining presence or absence of desired nucleic acids that contain multiple repeats of predetermined nucleic acid target sequences in a sample, by using nucleic acid hybridization methods.

Claim 1; Page 27; 31pp; English.

The invention describes a method of determining presence or absence of a desired nucleic acid (NA) that contains multiple repeats of a predetermined NA target sequence in a NA sample. The method involves providing a treated sample that may contain the desired NA in which several predetermined repeating NA target sequences are hybridised with a NA probe, analysing for presence of hybridised NA containing the NA probe, and thereby the presence or absence of the desired NA. The method probe, and thereby the presence or absence of the desired NA.

The methods can be efficiently used for distinguishing human and bacterial NA. The method is highly sensitive, and enables detection and quantification of the presence of a NA without the need to undergo a NA target sequence enrichment step prior to a NA hybrid detection step. The method enables rapid and accurate detection of a desired NA that contains multiple repeats of a NA target sequence. This sequence represents a probe used to detect the human Alu repeat sequences
desired nucleic acid (NA) that contains multiple repeats of a predetermined NA target sequence in a NA sample. The method involves providing a treated sample that may contain the desired NA in which several predetermined repeating NA target sequences are hybridised with sprobe, analysing for presence of hybridised NA containing the NA probe, analysing for presence or absence of the desired NA. The method is useful for determining the presence or absence of desired nucleic acids that contain multiple repeats of a predetermined NA target sequence, in a NA sample obtained from a biological sample, where the repeated sequence includes several predetermined repeated sequence that differ in length and/or sequence. The methods can be efficiently used for distinguishing human and bacterial NA. The method is highly sensitive,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Repeated nucleic acid detection; human; alu; probe; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Repeated nucleic

        The invention describes a method of determining presence or absence of a CC desired nucleic acid (NA) that contains multiple repeats of a CC desired nucleic acid (NA) that contains multiple repeats of a CC prodding a treated sample that may contain the desired NA in which several predetermined repeating NA target sequences are hybridised with a CC NA probe, analysing for presence of hybridised NA containing the NA CC is useful for determining the presence or absence of the desired NA. The method cis useful for determining the presence or absence of desired NA target CC acids that contain multiple repeats of a predetermined NA target CC sequence, in a NA sample obtained from a biological sample, where the CC distinguishing human and bacterial NA. The method is another that differ in length and/or sequence. The method is highly sensitive, CC and enables detection and quantification of the presence of a NA without the need to undergo a NA target sequence enrichment step prior to a NA contains multiple repeats of a NA target sequence. This desired NA that contains multiple repeats of a NA target sequence. This

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the need to undergo a NA target sequence enrichment step prior to a NA hybrid detection step. The method enables rapid and accurate detection a desired NA that contains multiple repeats of a NA target sequence. The method enables repeats of a NA target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ACA62880 standard; DNA; 16 BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
